

The Journey of the Rufous Hummingbird

Despite their small size—around 3 inches!—Rufous Hummingbirds make one of the longest migrations relative to body size of any bird. Traveling from the Pacific Northwest to Mexico, they cover thousands of miles each year.

Conservation Status: **Declining**

Rufous Hummingbird populations have declined by 67% between 1966 and 2019, with an average annual decline of 2%. Without conservation efforts, this species faces the risk of extinction.

- Migration

Spring Migration

~4,000 miles

Fall Migration

Rufous Hummingbirds have an excellent memory, returning to the same spots year after year to find reliable food sources. Attract these fascinating birds by planting flowers or setting up a feeder with a sugar water mix and be part of their journey.
